CONCLUSIONS

• BAMS assays have been configured for sample multiplexing. MALDI MS monitoring of both phospho- and nonphospho labeled samples was employed the within the same BAMS assay and the same MALDI MS instrument.
• The sample preparation of BAMS can be used for the parallel monitoring of phospho- and nonphospho analytes.

ACKNOWLEDGEMENTS

* Authors wish to thank the Johns Hopkins School of Medicine for the use of a 4-Mw Nd:YAG laser (from the Materials Science Research Center) and for financial support (J.C. Silva, 2001-2005). We also thank the Human Tissue Bank for generous donation of human brain tissues.
